Revolutionize System Modernization
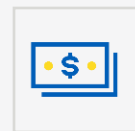

AI-Powered Application Modernization with CapTech

Modernizing legacy systems is a challenging and risky endeavor, often plagued by incomplete functionality, schedule delays, and cost overruns. Traditional methods, including code conversion toolsets, fall short by merely shifting outdated structures onto newer platforms without addressing underlying complexities.

LegacyLift utilizes an integrated multi-agent AI system that analyzes and understands the intricate intent of legacy systems. This innovative approach allows analysts and engineers to design modern solutions that retain the core intent of the original system, ensuring a smooth transition.
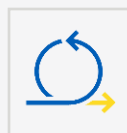

KEY FEATURES

Accelerates the modernization process

Minimizes risk and reduces cost

Understands and documents system intent

Provides continuous insights beyond initial implementation

Reduce Risk with Deep Insights

LegacyLift mitigates the risks of modernizing complex legacy systems by providing comprehensive insights only achievable through time-consuming and expensive manual analysis. This deep understanding helps in designing precise and functional modern solutions.

Understand Application Intent

This solution harnesses AI to accelerate and scale the ability to understand the intent of a legacy system, so analysts and engineers can design a modern solution that meets the needs of the organization.

Enhance Knowledge Accessibility

LegacyLift documents and organizes information from the legacy system into logical epics and user stories, making it accessible to all team members. This not only facilitates current modernization efforts but also provides valuable insights for future system maintenance and upgrades.

A Comprehensive Approach

By providing accelerated insights and a structured approach, LegacyLift lays the foundation for subsequent modernization work streams, enabling teams to efficiently navigate the complexities of the legacy application and drive the modernization effort forward with confidence.
